

# Appendix : Rigorous Derivation of Realizable Launch Inclination

- **Launch Initial Conditions**
- Position:  $\lambda$ , Latitude  
 $\Omega$ , Longitude (Inertial)  
 $h$ , Altitude

# What Happens at Launch?

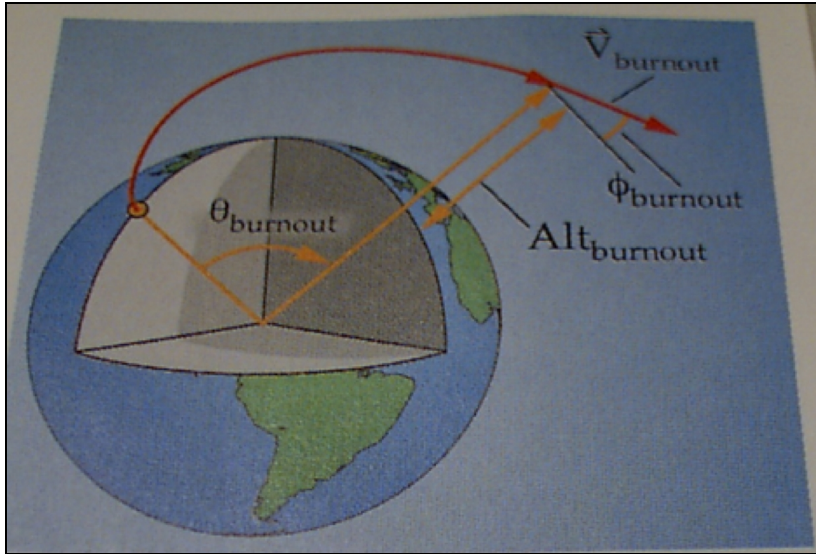

**Phases of Launch Vehicle Ascent.** During ascent a launch vehicle goes through four phases—vertical ascent, pitch over, gravity turn, and vacuum.

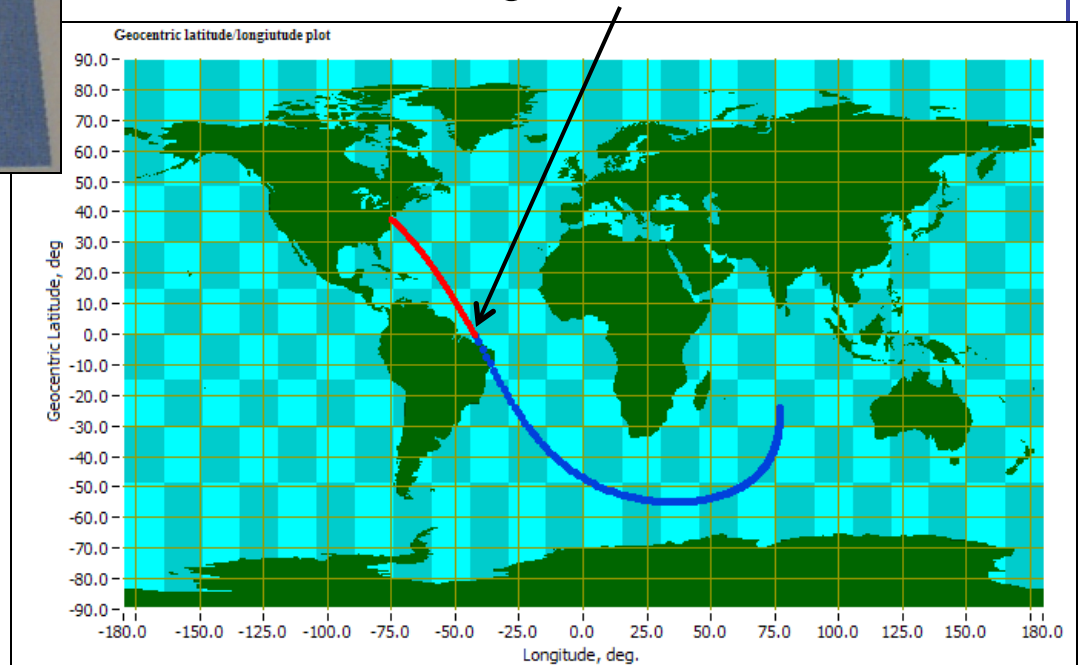

Gravity-turn maneuver of an ascending Delta II rocket with Messenger spacecraft on August 3, 2004.

# What Happens at Launch?

- Velocity and Position at Burnout Determine Orbit

## Final Stage Burnout

# What Happens on Launch?

• Example

Kennedy Space Center (KSC)

Due-East Launch

28.5° Inclination Orbit

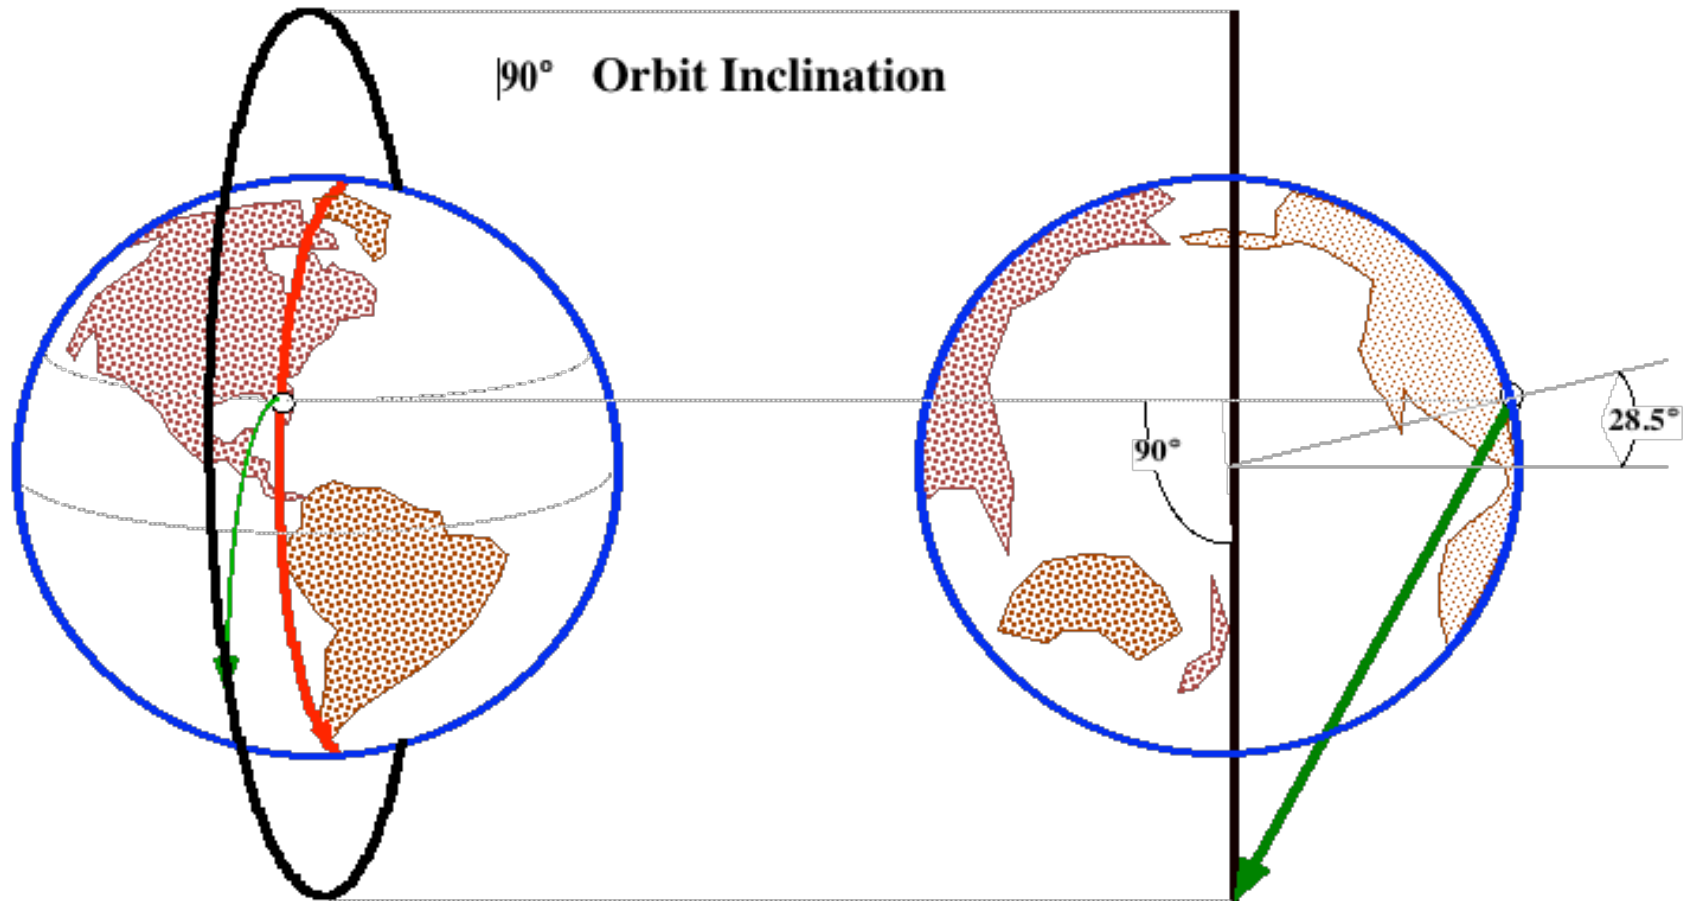

# What Happens on Launch? (cont'd)

• Example

**Kennedy Space Center (KSC)**

**Due South (from east )Launch Direction**

# What Happens on Launch? (cont'd)

• Example

**Kennedy Space Center (KSC)**

**30° North (from east) Launch Direction**

**40.4° Orbit Inclination Huh?**

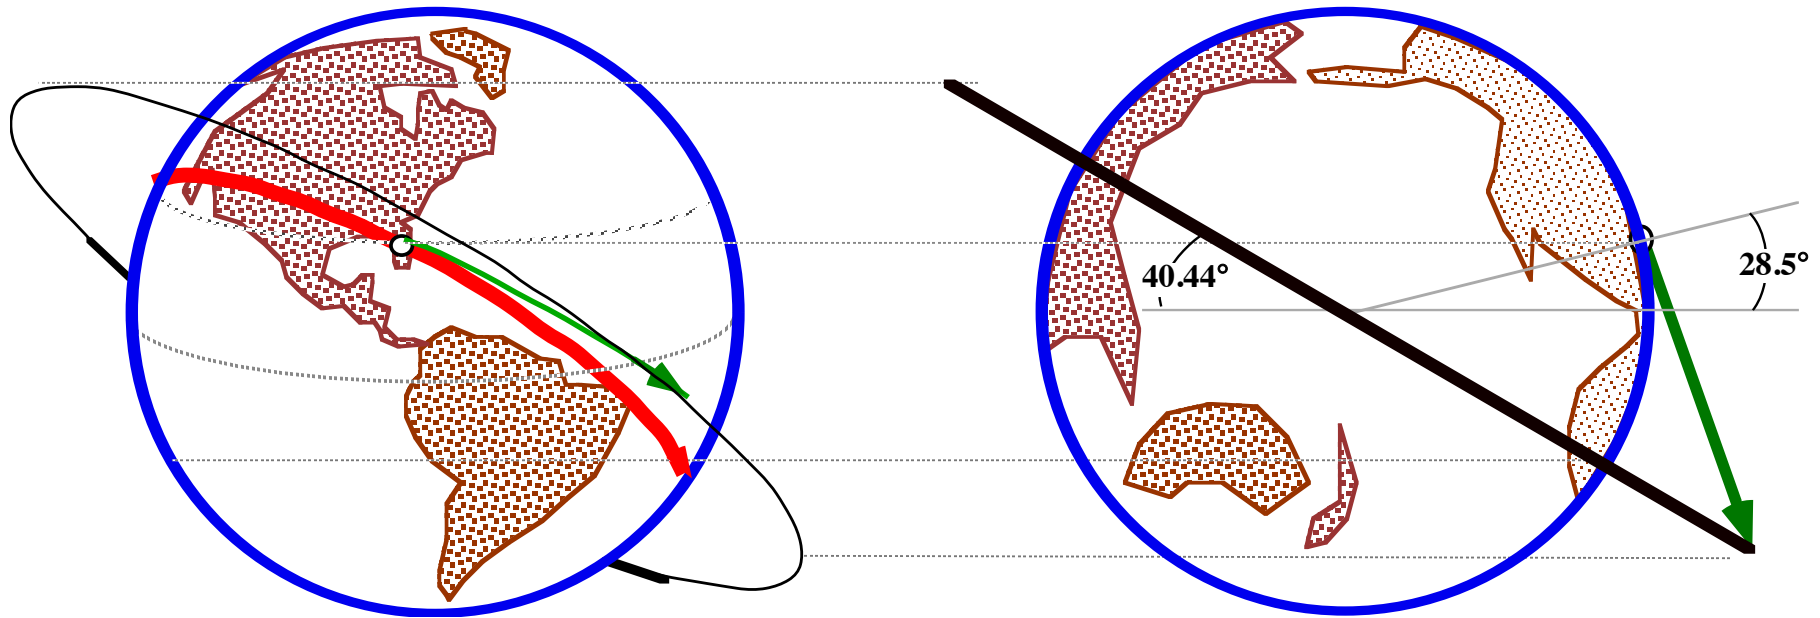

# What Happens on Launch? (cont'd)

• Example

**Kennedy Space Center (KSC)**  
**30° South (from east) Launch Direction**  
**40.44° Orbit Inclination**

**Huh?**

## Achieved Orbit Inclinations

[	0° Launch Angle	=	28.6° Inclination	]
	-90° Launch Angle		90° Inclination	
	30° Launch Angle		40.44° Inclination	
	-30° Launch Angle		40.44° Inclination	

**What?! Doesn't add up ...**

# "Spherical Geometry"

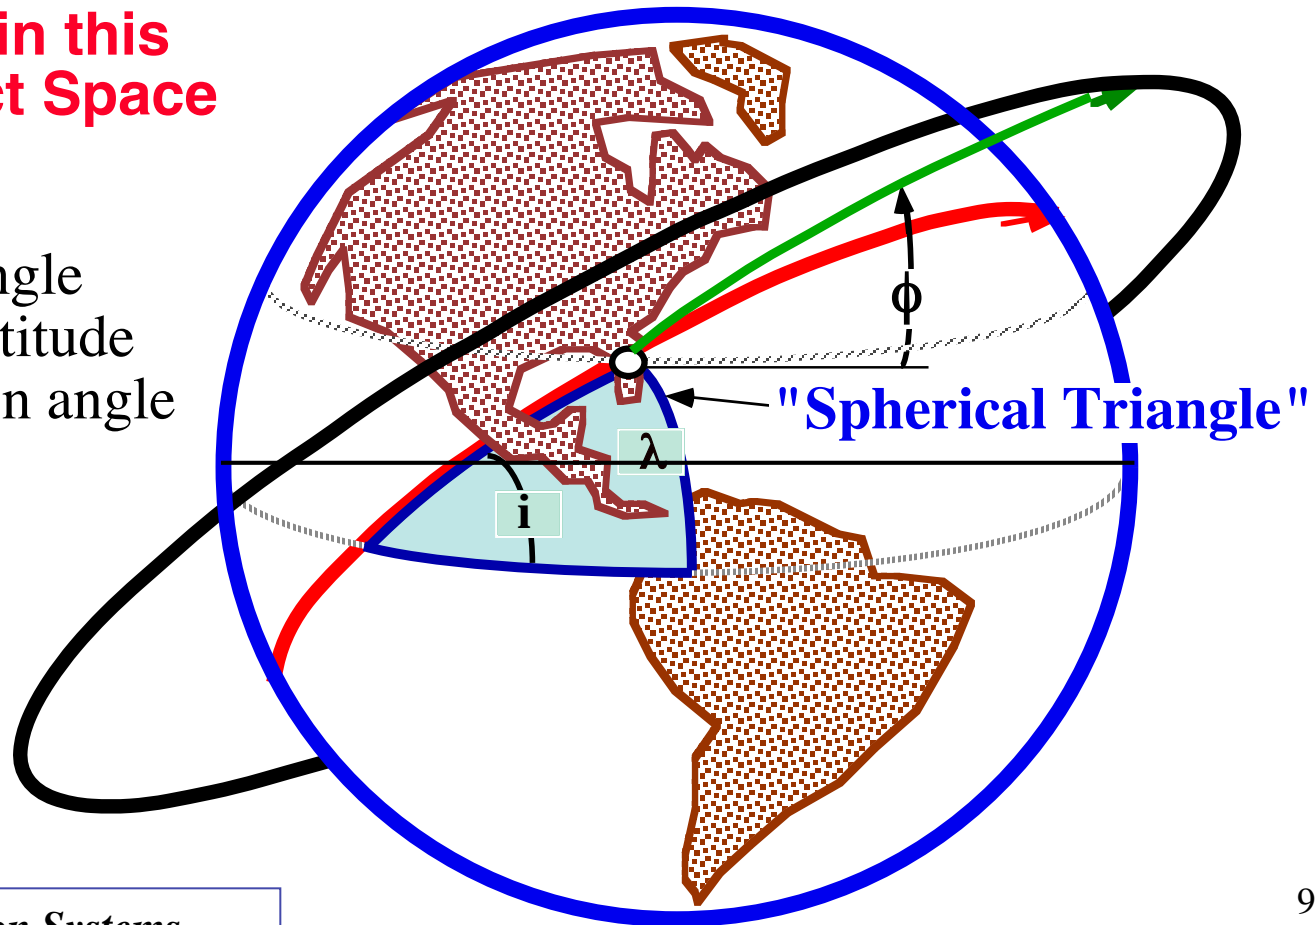

Kennedy Space Center (KSC)

30° North (from east) Launch Direction

40.44° Orbit Inclination

- **Non-Euclidian Space ...**  
**Addition Doesn't**  
**Exist! in this**  
**Abstract Space**

$\phi$  -- launch angle  
 $\lambda$  -- launch latitude  
 $i$  -- inclination angle

# "Spherical Geometry"

- **Non-Euclidian Space ...  
Addition Doesn't  
Exist! in this  
Abstract Space**

$\phi$  -- launch angle  
 $\lambda$  -- launch latitude  
 $i$  -- inclination angle

“fixed earth  
approximation”

$$\cos(i) = \cos(\phi) \cos(\lambda)$$

**Launch Angle sometimes expressed as  
"azimuth" ... angle from local true north**

$$Az = \begin{cases} 90^\circ - \phi \Rightarrow \text{degrees} \\ \frac{\pi}{2} - \phi \Rightarrow \text{radians} \end{cases}$$

$$\cos(i) = \cos(\lambda) \cdot \sin(Az)$$

**• then a miracle occurs:**

## Direct Launch Inclination Angle

$$\left[ \begin{aligned} i &= \frac{180^\circ}{\pi} \cos^{-1} \left[ \cos \left[ 30^\circ \frac{\pi}{180^\circ} \right] \times \cos \left[ 28.6^\circ \frac{\pi}{180^\circ} \right] \right] = 40.44^\circ \\ i &= \frac{180^\circ}{\pi} \cos^{-1} \left[ \cos \left[ -30^\circ \frac{\pi}{180^\circ} \right] \times \cos \left[ 28.6^\circ \frac{\pi}{180^\circ} \right] \right] = 40.44 \end{aligned} \right]$$

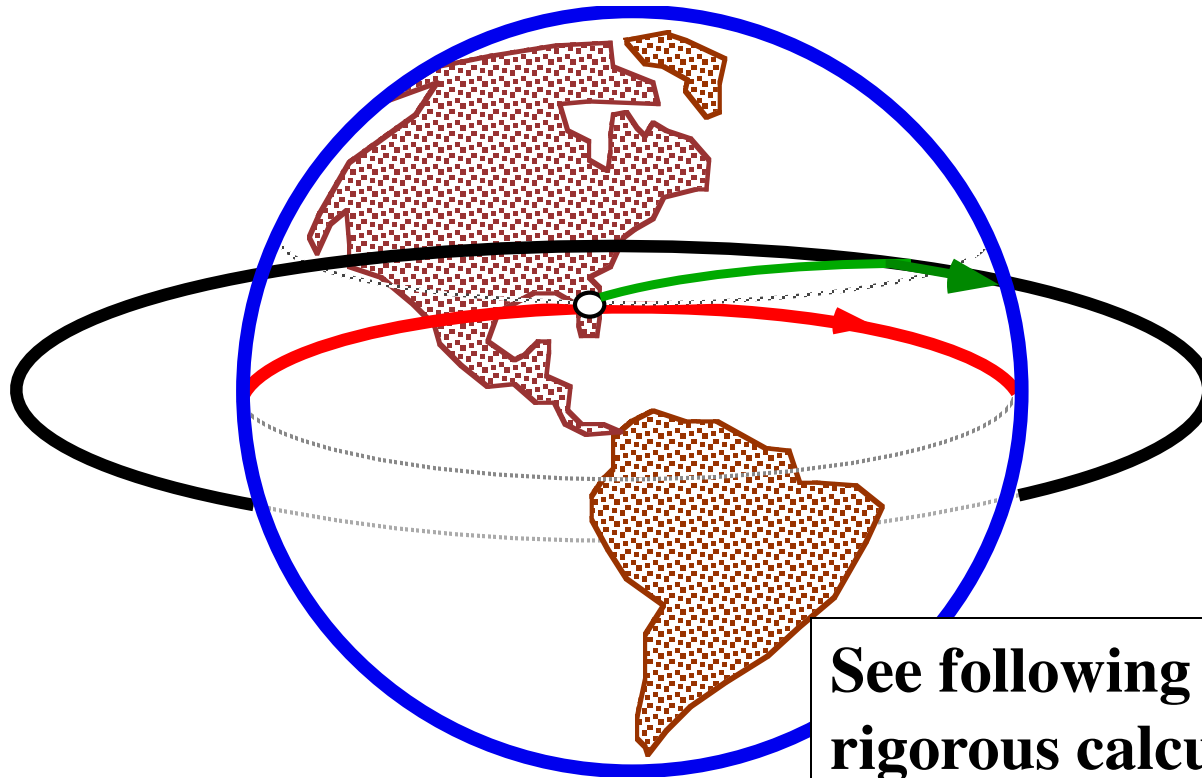

# Achievable Direct-Launch Inclination Angles

# Achievable Direct-Launch Inclination Angles

# Bottom Line

See following slides for  
rigorous calculation

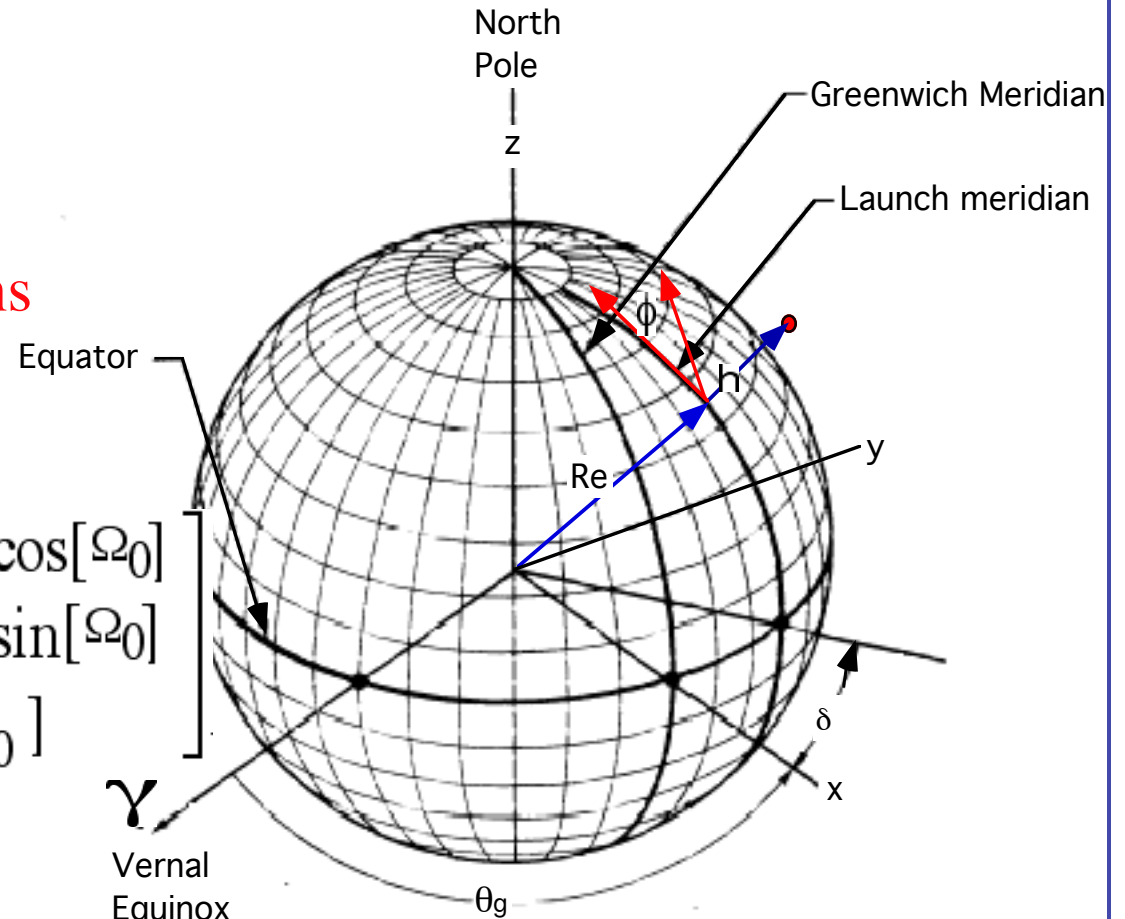

- ***Physically Impossible*** to Launch Directly into an orbit with a ***Lower*** inclination Angle than the Launch latitude
- **Physically Possible** to launch directly into any orbit with an inclination angle ***greater than or equal to*** launch latitude

• Launch Initial Conditions

• Launch Initial Conditions  
(Inertial Coordinates)

$$\begin{bmatrix} x_I \\ y_I \\ z_I \end{bmatrix}_0 = \begin{bmatrix} [R_{\text{earth}} + h_0] \cos[\lambda_0] \cos[\Omega_0] \\ [R_{\text{earth}} + h_0] \cos[\lambda_0] \sin[\Omega_0] \\ [R_{\text{earth}} + h_0] \sin[\lambda_0] \end{bmatrix}$$

$$\Omega_0 = \delta_0 + \theta_g$$

Sidereal hour angle

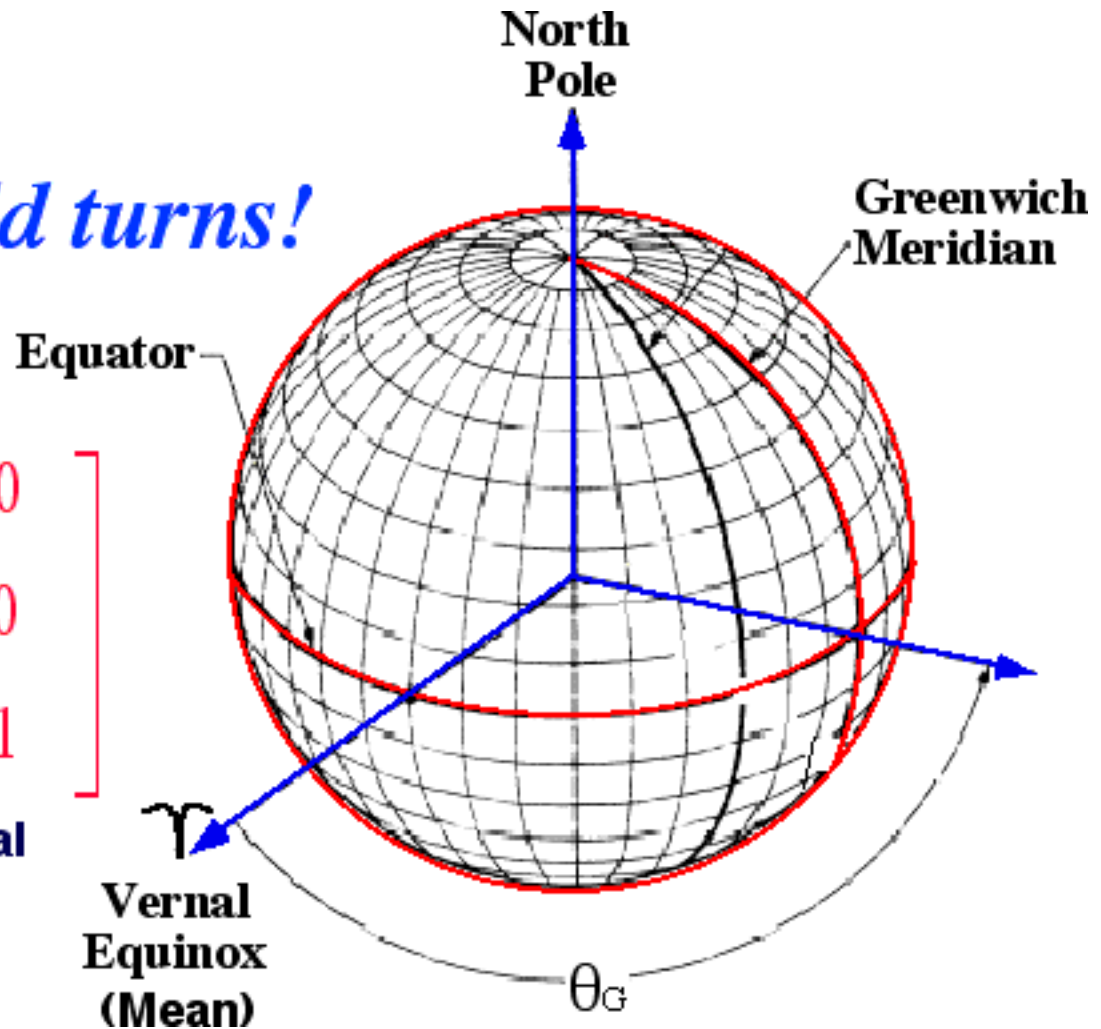

*As the world turns!*

$M_{\text{Rotation}} =$

$$\begin{bmatrix} \cos[\theta_G] & -\sin[\theta_G] & 0 \\ \sin[\theta_G] & \cos[\theta_G] & 0 \\ 0 & 0 & 1 \end{bmatrix}$$

**Greenwich Sidereal  
(Hour) Angle**

*Ignore for now!*

## Computing the Hour Angle

- $\theta_G$  Historically Expressed in Hours

... Sometimes referred to as Greenwich Mean Sidereal Time ... but we are going to treat it as an angle

$$\theta_G = \omega_{\text{earth}} \times [ T_{\text{GMST}} - T_{\text{JD2000}} ]$$

- Sidereal time is a measure of the Earth's rotation with respect to distant celestial objects.

- Earth Radius

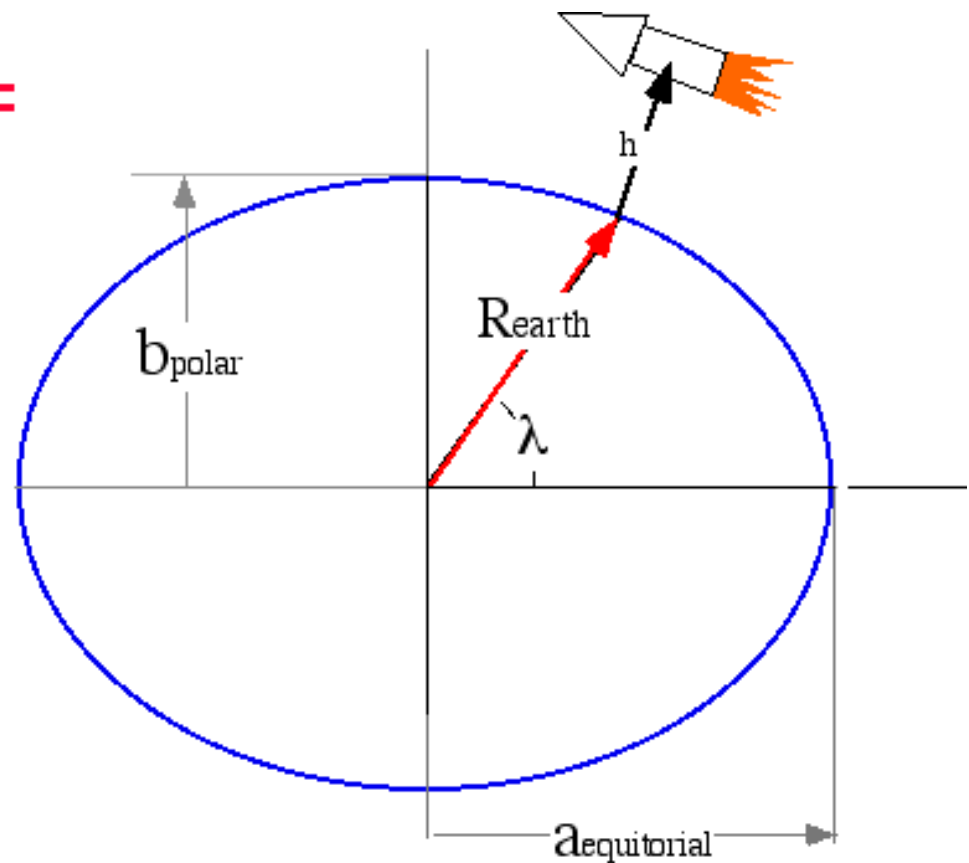

- Earth radius as Function of Latitude

$$R_{\text{earth}} = \frac{a_{\text{equitorial}}}{\sqrt{1 + \frac{e_{\text{earth}}^2}{1 - e_{\text{earth}}^2} \sin^2 \lambda}}$$

$$a_{\text{equitorial}} = 6378.13649 \text{ km}$$

$$b_{\text{polar}} = 6356.7515 \text{ km}$$

$$e_{\text{earth}} = \sqrt{1 - \left[ \frac{b_{\text{polar}}}{a_{\text{equitorial}}} \right]^2}$$

• Initial Velocity Vector

after the rocket “turns the corner”

• Launch Initial Conditions

- Velocity:  $V_0$  (earth relative vel.)
- $\gamma$  (flight path angle)
- $\phi$  (launch azimuth)

• Initial Velocity Vector

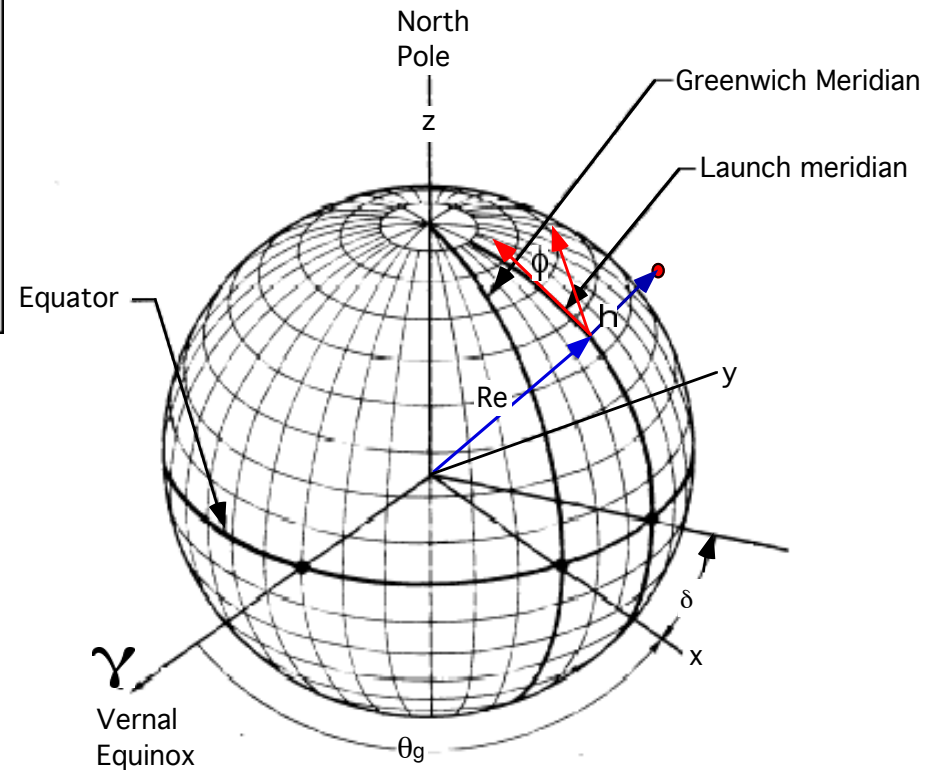

after the rocket “turns the corner”

• Launch Initial Conditions

$$\begin{bmatrix} V_{\text{north}} \\ V_{\text{east}} \\ V_{\text{down}} \end{bmatrix}_0 = \begin{bmatrix} V_0 \cos(\phi) \cos(\gamma) \\ V_0 \sin(\phi) \cos(\gamma) \\ -V_0 \sin(\gamma) \end{bmatrix}$$

+ rotational velocity  
of earth

$V_0$  (earth relative vel.)  
 $\gamma$  (flight path angle)  
 $\phi$  (launch azimuth)

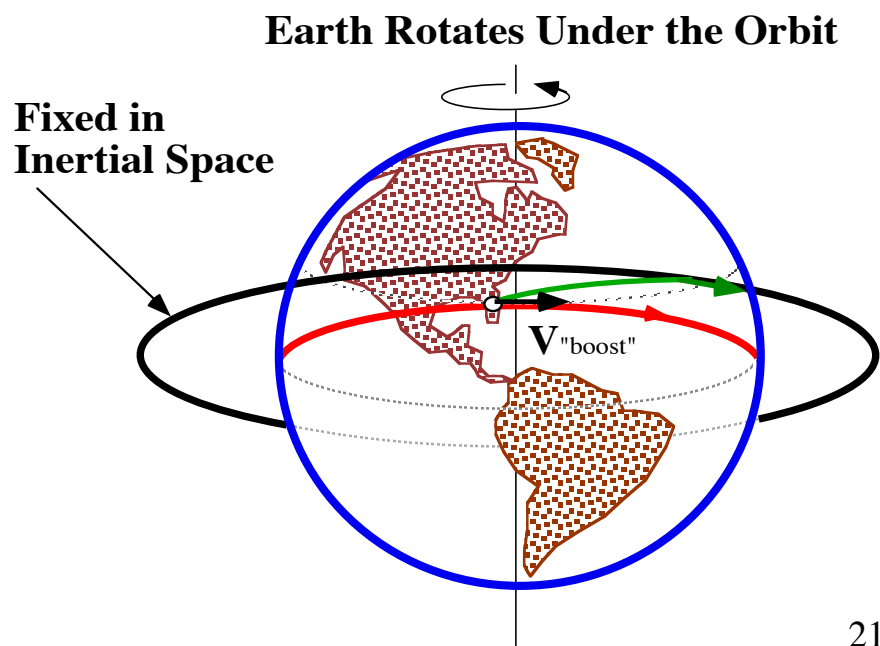

- Earth “Boost”

$\lambda_0 \equiv \text{geocentric latitude}$

$$V_{\text{boost}}^{(\text{earth})} = [R_{\text{earth}} + h_0]_{\text{launch}} [\Omega_{\text{earth}} \cos[\lambda_0]]$$

- Launch Initial Conditions

$V_{\text{boost}}^{(\text{earth})}$  acts due east

- Angular Velocity of Earth

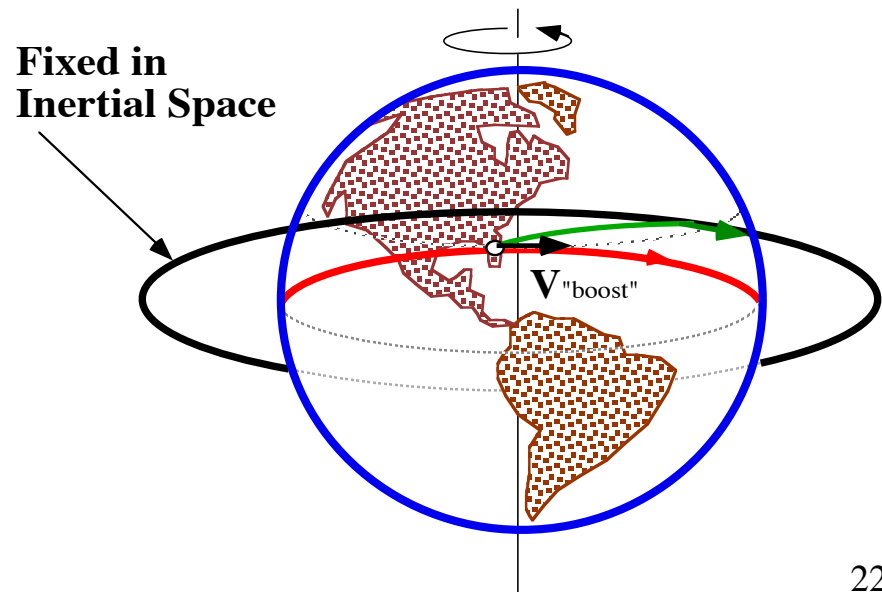

**Angular Velocity of the Earth**

- 1 Solar Day = 23 hrs 56 min 4.1 seconds = 86164.1 seconds
- $\Omega_{\text{earth}} = \frac{360^\circ}{86164.1 \text{ seconds}} \times \frac{\pi}{180^\circ} = .00007292115 \frac{\text{rad}}{\text{sec}}$

- **Launch Initial Conditions**

$V_{\text{boost}}^{(\text{earth})}$  acts due east

**Earth Rotates Under the Orbit**

- Initial Velocity Vector

after the rocket “turns the corner”

- Launch Initial Conditions

$$\begin{bmatrix} V_{\text{north}} \\ V_{\text{east}} \\ V_{\text{down}} \end{bmatrix}_0 = \begin{bmatrix} V_0 \cos(\phi) \cos(\gamma) \\ V_0 \sin(\phi) \cos(\gamma) + [R_{\text{earth}} + h_0]_{\text{launch}} [\Omega_{\text{earth}} \cos[\lambda_0]] \\ -V_0 \sin(\gamma) \end{bmatrix}$$

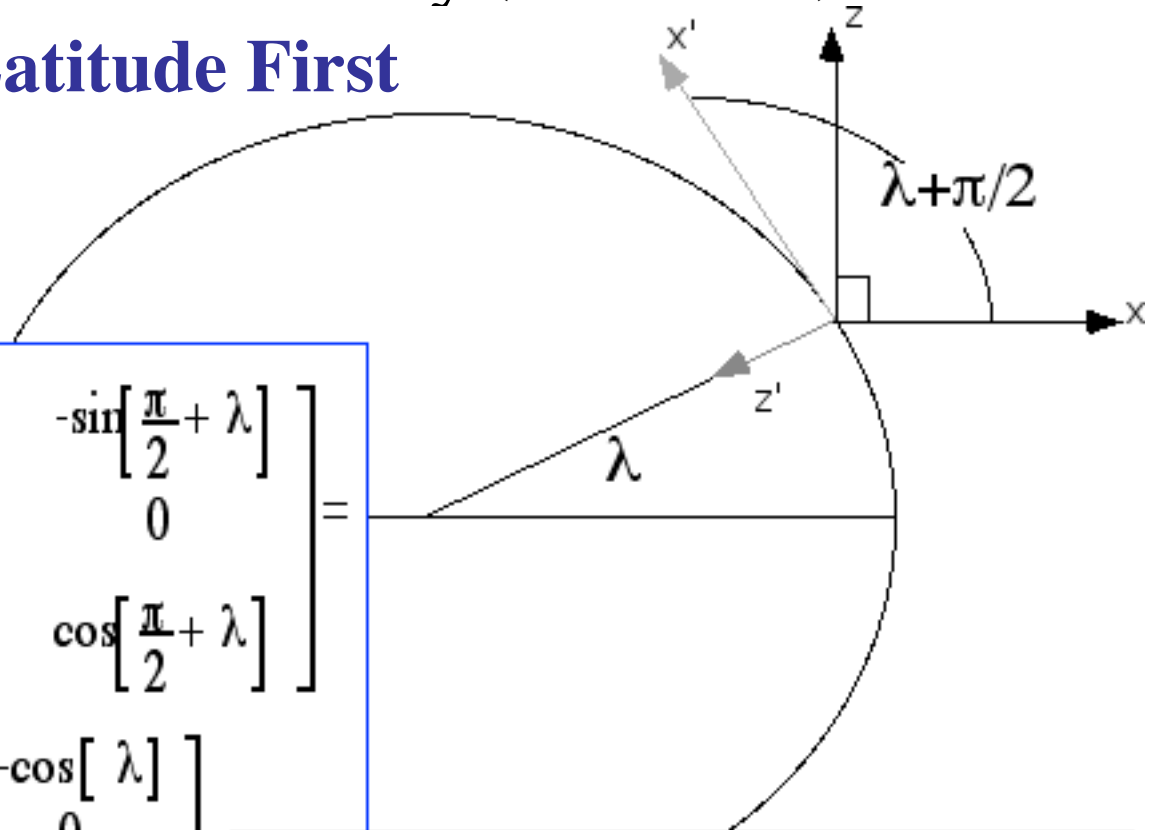

$$\begin{bmatrix} \phi \\ \lambda \end{bmatrix} \equiv \begin{bmatrix} \text{launch azimuth (from due north)} \\ \text{geocentric latitude} \end{bmatrix}$$

# Inertial Velocity (Initial condition)

## Rotate Through Latitude First

2-rotation

- **Clock-wise rotation**

$$M_{\lambda} = \begin{bmatrix} \cos\left[\frac{\pi}{2} + \lambda\right] & 0 & -\sin\left[\frac{\pi}{2} + \lambda\right] \\ 0 & 1 & 0 \\ \sin\left[\frac{\pi}{2} + \lambda\right] & 0 & \cos\left[\frac{\pi}{2} + \lambda\right] \end{bmatrix} = \begin{bmatrix} -\sin[\lambda] & 0 & -\cos[\lambda] \\ 0 & 1 & 0 \\ \cos[\lambda] & 0 & -\sin[\lambda] \end{bmatrix}$$

$$\cos\left[\frac{\pi}{2} + \lambda\right] = \cos\left[\frac{\pi}{2}\right]\cos[\lambda] - \sin\left[\frac{\pi}{2}\right]\sin[\lambda] = -\sin[\lambda]$$

$$\sin\left[\frac{\pi}{2} + \lambda\right] = \cos\left[\frac{\pi}{2}\right]\sin[\lambda] + \sin\left[\frac{\pi}{2}\right]\cos[\lambda] = \cos[\lambda]$$

No 1 (X-axis) rotation  
Needed Why? z` already points  
Towards center of earth

# Inertial Velocity (Initial condition)

Rotate Through Longitude Next

$$M_{\delta} = \begin{bmatrix} \cos[\Omega_0] & -\sin[\Omega_0] & 0 \\ \sin[\Omega_0] & \cos[\Omega_0] & 0 \\ 0 & 0 & 1 \end{bmatrix}$$

• **Clock-wise rotation**

## Inertial Velocity (Initial condition)

$$\begin{bmatrix} V_x \\ V_y \\ V_z \end{bmatrix}_{\text{Inertial}} = \begin{bmatrix} -\cos[\Omega_0] \sin[\lambda_0] & -\sin[\Omega_0] & -\cos[\Omega_0] \cos[\lambda_0] \\ -\sin[\Omega_0] \sin[\lambda_0] & \cos[\Omega_0] & -\sin[\Omega_0] \cos[\lambda_0] \\ \cos[\lambda_0] & 0 & -\sin[\lambda_0] \end{bmatrix} \begin{bmatrix} V_0 \cos(\phi) \cos(\gamma) \\ V_0 \sin(\phi) \cos(\gamma) + [R_{\text{earth}} + h_0] \Omega_{\text{earth}} \cos(\lambda_0) \\ -V_0 \sin(\gamma) \end{bmatrix}$$

## Initial Conditions In Inertial Coordinates

$$\begin{bmatrix} R_x \\ R_y \\ R_z \end{bmatrix}_{\text{Inertial}} = \begin{bmatrix} [R_{\text{earth}} + h_0] \cos[\lambda_0] \cos[\delta_0] \\ [R_{\text{earth}} + h_0] \cos[\lambda_0] \sin[\delta_0] \\ [R_{\text{earth}} + h_0] \sin[\lambda_0] \end{bmatrix}$$

$$\begin{bmatrix} V_x \\ V_y \\ V_z \end{bmatrix}_{\text{Inertial}} =$$

$$\begin{bmatrix} -\cos[\Omega_0] \sin[\lambda_0] & -\sin[\Omega_0] & -\cos[\Omega_0] \cos[\lambda_0] \\ -\sin[\Omega_0] \sin[\lambda_0] & \cos[\Omega_0] & -\sin[\Omega_0] \cos[\lambda_0] \\ \cos[\lambda_0] & 0 & -\sin[\lambda_0] \end{bmatrix} \begin{bmatrix} V_0 \cos(\phi) \cos(\gamma) \\ V_0 \sin(\phi) \cos(\gamma) + [R_{\text{earth}} + h_0] \Omega_{\text{earth}} \cos(\lambda_0) \\ -V_0 \sin(\gamma) \end{bmatrix}$$

Out-of-plane orbital elements (cont'd)

Inclination Angle

$$\bar{l} = \bar{R} \times \bar{V}$$

$$\cos(i) = \frac{(\bar{k} \cdot \bar{l})}{\|\bar{l}\|} = \frac{\bar{l}_z}{\|\bar{l}\|}$$
